

March 21<sup>th</sup>, 2025

Pierre Adrien  
District Manager, Ministry of the Environment, Conservation and Parks  
733 Exeter Road  
London, ON N6E 1L3

Dear Mr. Adrien;

**Re: Annual Wastewater Report  
Dorchester Wastewater Treatment Plant and Sanitary Collection System**

Attached is the 2024 Annual Performance Report for the Dorchester Wastewater Treatment Facility, all associated sewage pumping stations (SPS's) and the Dorchester Linear Infrastructure. This report has been completed in accordance with the following Approvals:

- Environmental Compliance Approval 8184-B4DJ45 issued October 31, 2018
- CLI-ECA Number: 059-W601 Issue 1

This report, as it pertains to the WWTF and the SPS was prepared by the Ontario Clean Water Agency on behalf of the Municipality of Thames Centre, based on the information contained in our records. The report included in Appendix A on the Dorchester linear infrastructure was provided by the Municipality of Thames Centre. The report covers the period from January 1, 2024 to December 31, 2024.

Please feel free to contact me should you require any additional information regarding this report. I can be reached at 519-870-7841.

Sincerely,

Matthew Belding  
Process and Compliance Technician  
Ontario Clean Water Agency

Cc. Jarrod Craven, Director of Public Works, Thames Centre  
Kevin Willson, Environmental Services Superintendent, Thames Centre  
Sam Sianas, Regional Hub Manager, Ontario Clean Water Agency  
Vitaliy Talashok, Senior Operations Manager, Ontario Clean Water Agency  
Maegan Garber, Safety, Process and Compliance Manager, Ontario Clean Water Agency  
Andrew Winkler, Ministry of Environment, Conservation and Parks

Appendix D: Preventative Maintenance Schedule	

## **Section 1: Overview of System**

The Dorchester Wastewater Treatment Plant is a modified sequential batch reactor (SBR) treatment plant, known as intermittent cycle extended aeration system (ICEAS). This process differs from the conventional SBR system by allowing for continuous inflow of wastewater. This supplies a constant food source and equalizes the flow to the two basins. Upgrades of the plant occurred in 2019 with commissioning in 2020. These upgrades included the addition of Dorchester Pump Station #3, two SBR basins, two filtration units and replacement of the UV System. This annual report will follow the requirements of the proposed works identified in the ECA. The process is as follows:

### *Raw Wastewater Collection*

The wastewater collection system is operated under CLI-ECA Number: 059-W601 issued February 14<sup>th</sup>, 2023.

The wastewater is collected by gravity and directed to the pump station located on Mitchell Court. Pump station #3 pumps into the Main PS located on Mitchell Court. The Main pump station is equipped with two submersible pumps (duty/stand by) with rated capacity of 21.5L/s. The pumps are controlled by the Milltronics ultrasonic level control system, with a backup float system. A diesel generator is onsite for backup power when required. Pump station #3 is equipped with three submersible pumps (two duty, one stand-by) with a rated capacity of 65.3L/s. The pumps are controlled by the Milltronics ultrasonic level control system, with a backup float system. A diesel generator is onsite for backup power when required.

### *Inlet Works*

The raw wastewater is pumped from the pump station to the grit channel and mechanical fine step bar screen for removal of larger material.

### *Sequential Batch Reactors*

There are four reactors (basins), each 13m x 4.7m x 5.0m depth (two running at a time). They are each equipped with fine bubble aeration system, decanter, level control, mechanical mixers within the react zone and waste activated sludge pumps. The aeration system is controlled by three blowers (one blower per two basins).

### *React Phase*

During the react phase the raw wastewater flows into the pre-react zone continuously to react with the mixed liquor suspended solids. During this phase the basin contents are aerated, anoxically mixed and reacted anaerobically based on a timer. The react phase allows for biological oxidation/reduction reactions to take place to treat the incoming wastewater. Aluminum sulfate is added towards the end of this phase to chemically remove phosphorus. The alum system consists of a 16,200L tank with two (duty/standby) metering pumps.

### *Settle Phase*

After the react phase, the basin is allowed to settle during the settle phase. This allows the solids to settle to the bottom of the basin. The raw wastewater continues to flow into the pre-react zone as the main react zone is settling. A clear layer of water will form on the top of the basin during this phase.

### *Decant Phase*

Once the timer is complete on the settling phase the decant phase begins. The decant motor lowers the decanter into the basin to draw off the clarified supernatant formed during the settle phase. This clear liquid is then directed to the effluent line. The raw wastewater continues to flow into the pre-react zone as this phase continues. Settled solids (sludge) on the bottom of the basin are wasted to the sludge holding tank during this cycle.

### *Post-Secondary Treatment*

Two filtration units with cloth media filter disc (operated in series).

### *Disinfection Phase*

The effluent is directed by gravity to the open channel with two ultra-violet (UV) disinfection bank systems (one duty, one standby) before being finally discharged to the Thames River.

### *Sludge Management System*

The mixed liquor suspended solids in the react phase are controlled by the wasting pumps operated in the decant phase. This waste sludge is directed to the sludge holding tank (10.5m x 9.9m x 5.0m). This tank is equipped with a fine bubble aeration system controlled by a blower. The tank also contains a decanter to remove the clear liquid and return it to the head of the plant for re-processing. Periodically the sludge is hauled off site by a licensed hauler and land applied if possible, alternatively it is hauled to another facility for further processing.

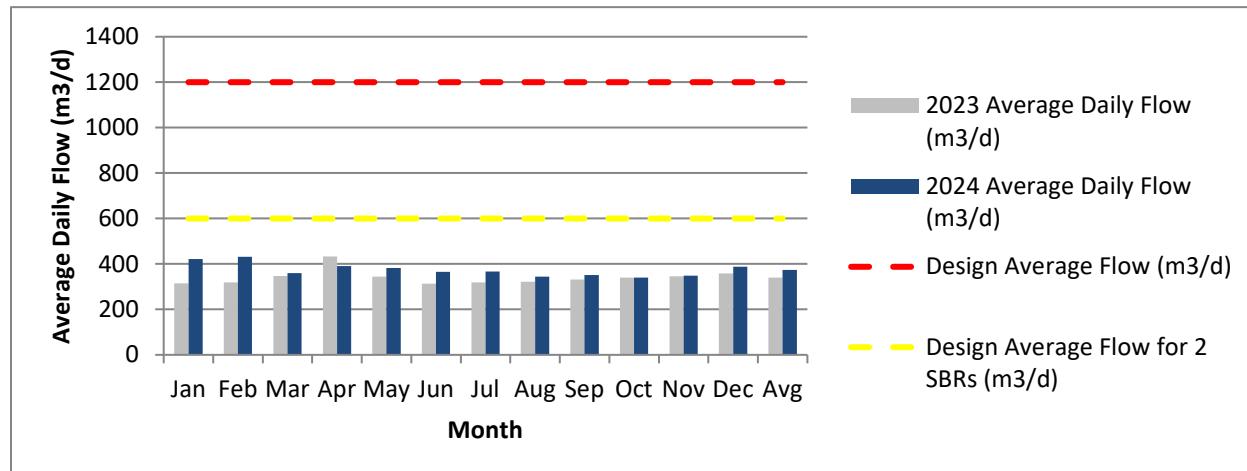

### *Standby Power*

The wastewater treatment plant has an automatic standby generator that will transfer over when there is a power failure. This allows for continuous running of the plant when outages occur.

## Section 2: Summary and Interpretation of Influent Monitoring Data

The average daily flow of raw wastewater entering the Dorchester Wastewater Treatment Plant in 2024 was 373.9m<sup>3</sup>/d. This represents an 8.9% increase from 2023 flows, refer to Chart 1. The rated capacity of the plant is 1,200m<sup>3</sup>/day. The plant is operating at 31.2% capacity. There are currently only two SBRs in operation which renders the capacity of the plant to 600m<sup>3</sup>/day. The plant is operating at 62.3% capacity of two SBRs.

Chart 1. Average daily flows for each month in 2024 compared to 2023 flows.

There were no instances during the reporting period that the flow exceeded the rated capacity of the two SBRs in operation, 600 m<sup>3</sup>/day, refer to Table 1.

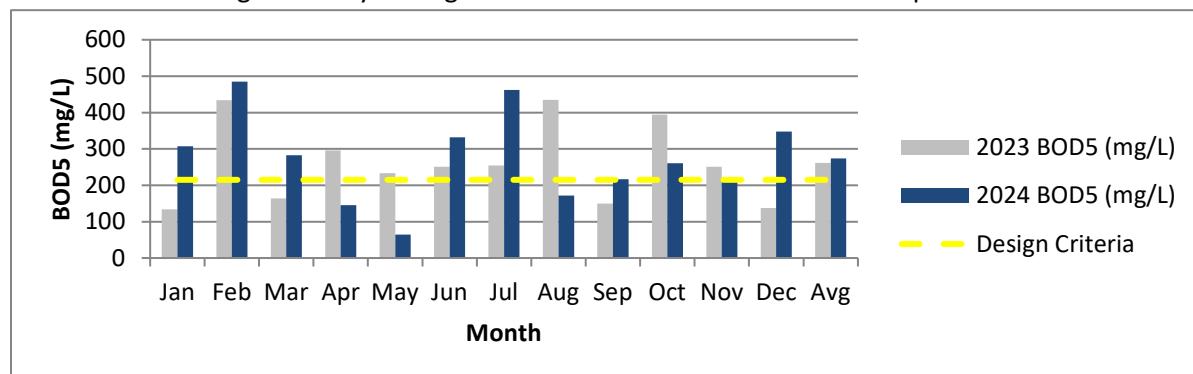

Table 1. Flow Exceedance for 2024.

Date	Flow (m <sup>3</sup> )
There were no flow exceedances during the reporting period	

The raw wastewater is monitored for BOD<sub>5</sub>, total suspended solids (TSS), total phosphorus (TP) and total Kjeldahl nitrogen (TKN) on a monthly basis by composite sampler. The plant was designed based on typical raw water characteristics. Refer to Table 2 for the design raw wastewater concentrations and loadings compared to results for 2024. Attached as Appendix B are the detailed monthly results for 2024.

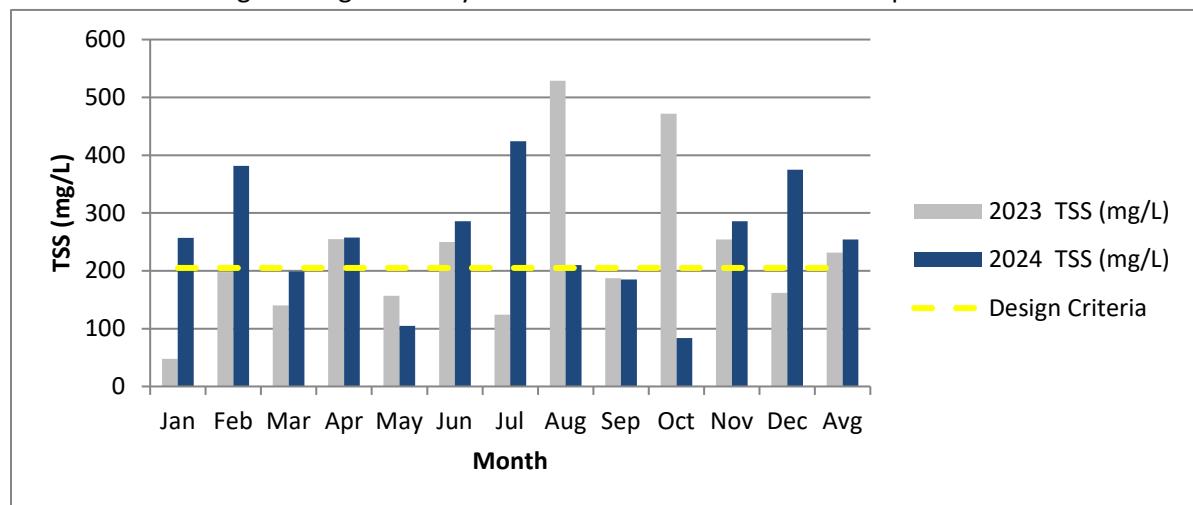

The annual average for raw sewage BOD<sub>5</sub> concentration to the plant in 2024 was 274.1mg/L with a maximum concentration of 485mg/L. The average concentration of BOD<sub>5</sub> has increased by 5.0% from 2023, refer to Chart 2. In eight (8) out of the twelve (12) months the average concentration was above the design criteria for the plant. The average BOD<sub>5</sub> loading to the plant was 100kg/d for 2024.

Chart 2. Raw sewage monthly average concentration of BOD<sub>5</sub> for 2024 compared to 2023.

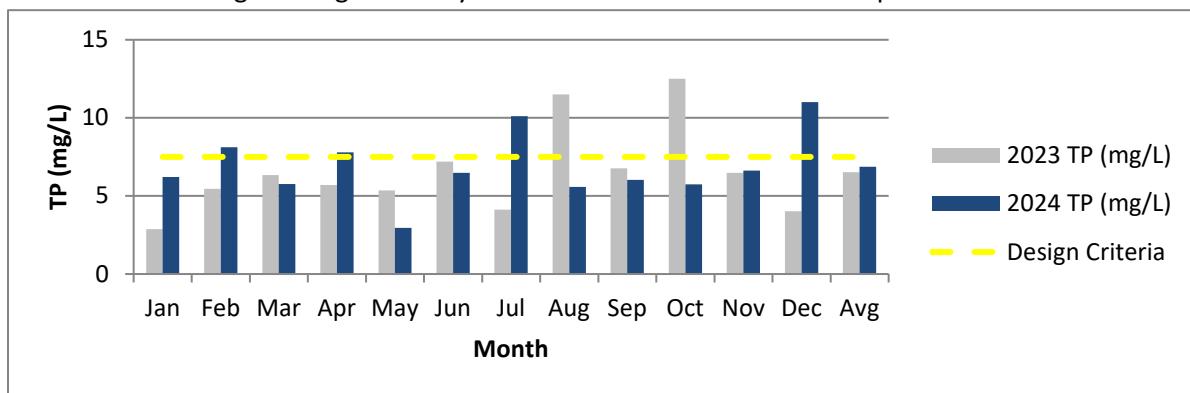

The annual average for raw sewage total suspended solids (TSS) concentration to the plant in 2024 was 254.2mg/L, with a maximum concentration of 424mg/L. The average concentration of TSS has decreased by 9.9% from 2023, refer to Chart 3. There were eight (8) instances in 2024 that the TSS concentrations exceeded the design criteria for the plant. The average TSS loading to the plant was 95kg/d for 2024.

Chart 3. Raw sewage average monthly concentration of TSS for 2024 compared to 2023.

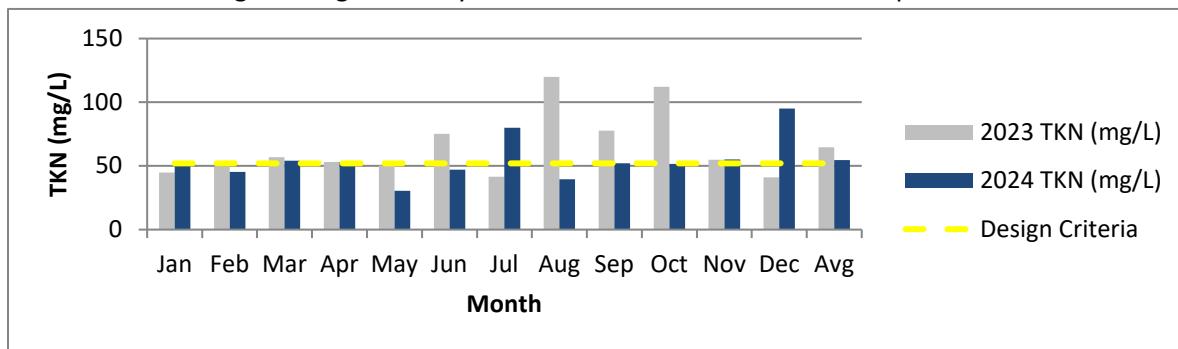

The annual average for raw sewage total phosphorus (TP) concentration to the plant in 2024 was 6.86mg/L with a maximum concentration of 11.0mg/L. There were four (4) TP concentrations in 2024 that were above the design criteria for the plant. The average TP loading to the plant was 2.6kg/d for 2024.

Chart 4. Raw sewage average monthly concentration of TP for 2024 compared to 2023.

The annual average for raw sewage total Kjeldahl nitrogen (TKN) concentration to the plant in 2024 was 54.5mg/L with a maximum concentration of 95mg/L. The average concentration of TKN has decreased by 15.7% from 2023, refer to Chart 5. In five (5) out of the twelve months the average concentrations were above the design criteria for the plant. The average TKN loading to the plant was 20.4kg/d for 2024.

Chart 5. Raw sewage average monthly concentration of TKN for 2024 compared to 2023.

There were several months during the reporting period when the raw wastewater results were above the design parameters for BOD<sub>5</sub>, TSS, TP, and TKN. See Table 2 below for the design parameters compared to the results in 2024. There were twenty five (25) concentration design exceedances in 2024 compared to twenty two (22) exceedances in 2023. Despite these results being above the concentrations that the plant was designed for, it has performed well.

Table 2. Design raw wastewater concentrations and loadings compared to results for 2024.

Parameter	Design Concentration Proposed Works (mg/L)	Monthly Concentrations (mg/L)	# Months Above Design	Design Loading Proposed Works (kg/d)	Monthly Loading (kg/d)	# Months Above Design
BOD <sub>5</sub>	215	64 – 485	8	258	24.5 – 134.8	0
TSS	205	84 – 424	8	246	28.6 – 164.7	0
TP	7.5	2.95 – 11.0	4	9	1.1 – 4.3	0
TKN	52	30.4 – 95.0	5	62	11.6 – 36.8	0

There is no monitoring data captured at the sewage pumping stations to be discussed in accordance with Schedule E, condition 4.6.3. At this time, there is no need for future modifications to the sewage pumping stations.

### Section 3: Summary and Interpretation of Effluent Monitoring Data

Effluent is sampled on a weekly basis and tested for cBOD<sub>5</sub>, total suspended solids, total phosphorus and total ammonia as a composite sample. An effluent grab sample is also taken weekly and tested for E.coli, pH and temperature;pH and temperature are used in the calculation of unionized ammonia. Detailed results are found in Appendix B. Table 3 below shows the monthly average effluent result ranges and loadings compared against the limits of the ECA.

The Dorchester Wastewater Treatment Plant does not have an effluent flow meter, the raw flow meter provides the quantity of flow treated at the plant.

Table 3. Monthly average effluent result ranges for 2024.

Parameter	Monthly average effluent limits (mg/L)	Monthly Average Effluent Result Ranges(mg/L)	Monthly average loading limit (kg/day)	Monthly Average Loadings Result Ranges (kg/d)
cBOD5 (mg/L)	10	2.4 – 5.2	12	0.68 – 1.91
TSS (mg/L)	10	3.6 – 7.0	12	1.39 – 2.44
TP (mg/L)	0.43	0.10 – 0.41	0.52	0.04 – 0.15
TAN (mg/L)	2	0.30 – 1.08	2.4	0.11 – 0.41
TAN (mg/L) Freezing*	3	0.23 – 2.48	3.6	0.10 – 1.05
E. coli (cfu/100mL)**	150	1.5 – 9.41	n/a	n/a
pH***	6.0-9.5	7.02 – 8.08	n/a	n/a
Temperature (°C)***	n/a	9.9 – 21.1	n/a	n/a

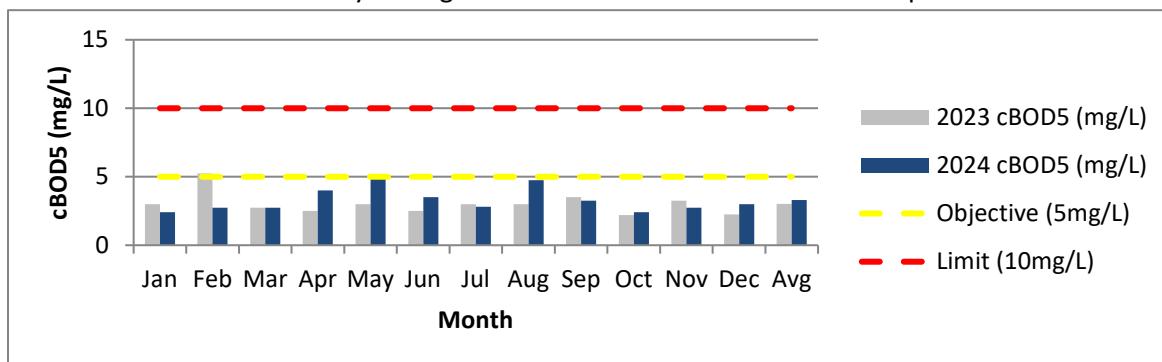

\* limits for December 1 to April 30

\*\*expressed as geometric mean

\*\*\*minimum and maximum result (not monthly averages)

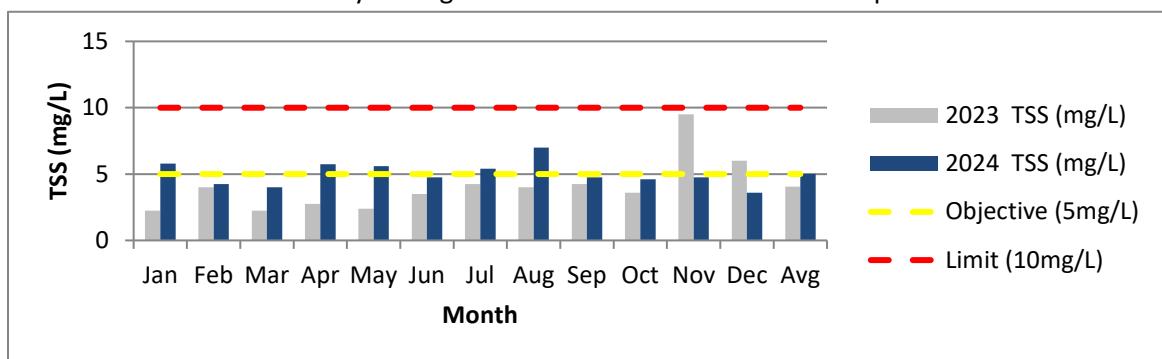

The annual average for effluent cBOD<sub>5</sub> concentration in 2024 was 3.30mg/L, which has increased by 9.3% from the 2023 annual average (see Chart 6). The annual loading of cBOD<sub>5</sub> was 1.5kg/d. The limits of the ECA were not exceeded in 2024 as depicted in Chart 6. There was one (1) objective exceedance in May due to low DO in the sludge storage tank and thus, the decant was effecting effluent quality (Refer to Section 12).

Chart 6. The effluent monthly average concentration of cBOD<sub>5</sub> in 2024 compared to 2023.

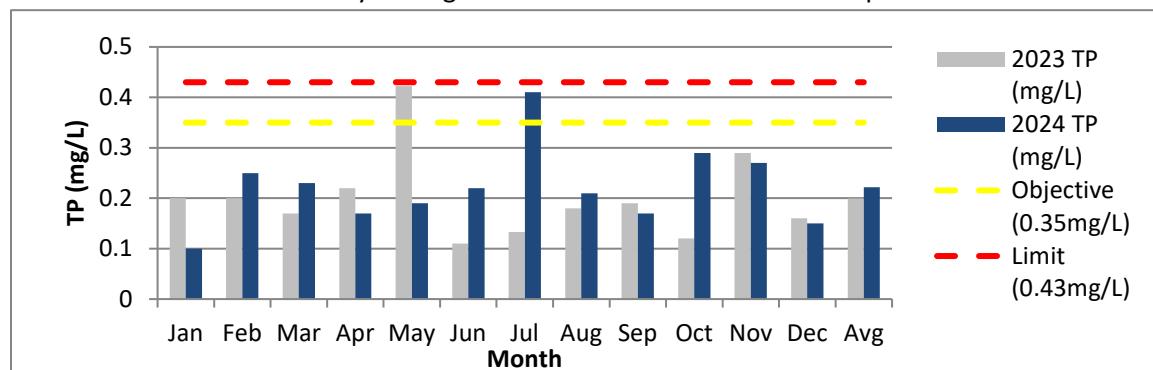

The annual average for effluent TSS concentration in 2024 was 5.02mg/L, which increased by 23.6% from the 2023 annual average (refer Chart 7). The annual loading of TSS was 2.29kg/d. The limits in the ECA were not exceeded in 2024 as depicted in Chart 7. There were five (5) objective exceedances which occurred in January, April, May, July, and August due to filamentous foam (Refer to Section 5).

Chart 7. The effluent monthly average concentration of TSS in 2024 compared to 2023.

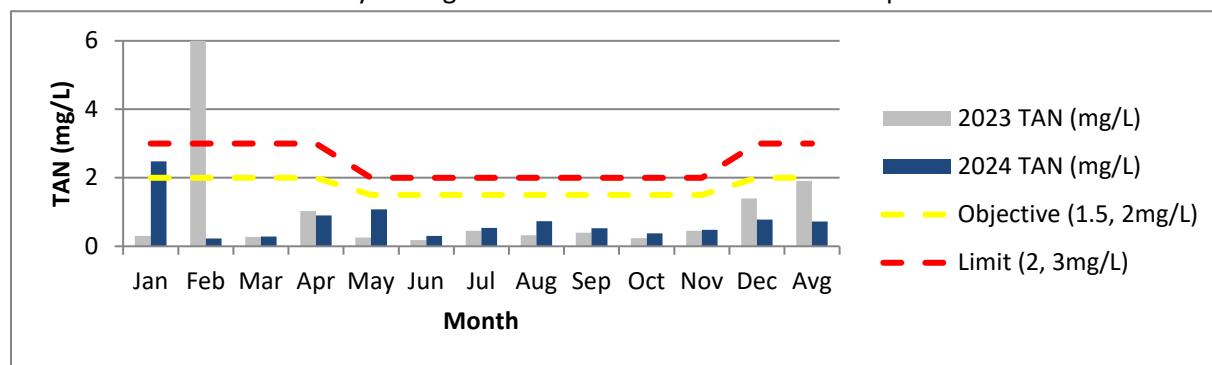

The annual average for effluent TP concentration in 2024 was 0.22mg/L, which increased by 11.0% from the 2023 annual average (refer Chart 8). The annual loading of TP was 0.10kg/d. The limits of the ECA were not exceeded in 2024 as depicted in Chart 8. There was one (1) objective exceedance in July due to the failure of the decant arm in SBR#3 thus an emergency switch over to another SBR tank. (Refer to Section 5).

Chart 8. The effluent monthly average concentration of TP in 2024 compared to 2023.

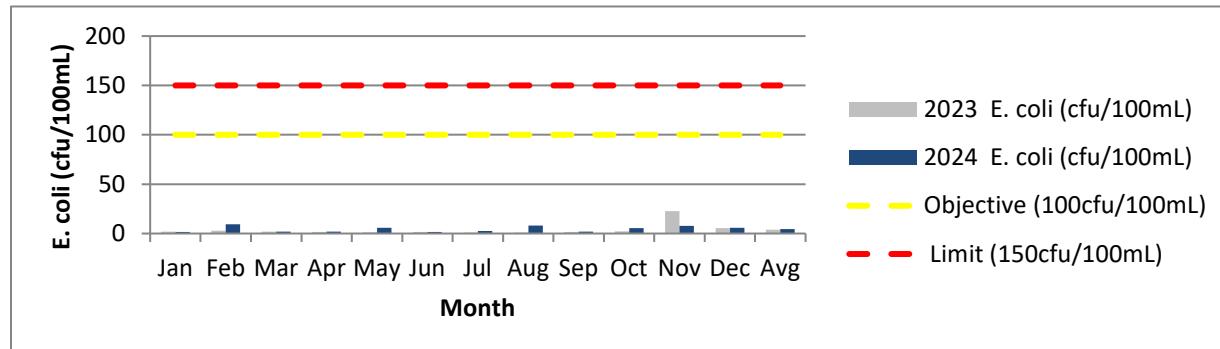

The annual average for effluent Total Ammonia Nitrogen (TAN) concentration in 2024 was 0.73mg/L, which decreased by 62.0% from the 2023 annual average (see Chart 9). The annual loading of TAN was 0.33kg/d. Refer to Chart 9. In 2024, there was one (1) objective exceedance for TAN which occurred in January. This objective exceedance was due to the switching of SBR tanks in cold weather due to equipment failure. (Refer to section 5).

Chart 9. The effluent monthly average concentration of TAN in 2024 compared to 2023.

The annual geometric mean for effluent E. coli in 2024 was 4.46cfu/100mL, which increased by 18.1% from 2023 annual geometric mean (see Chart 10). There were no limit or objective exceedances in 2024.

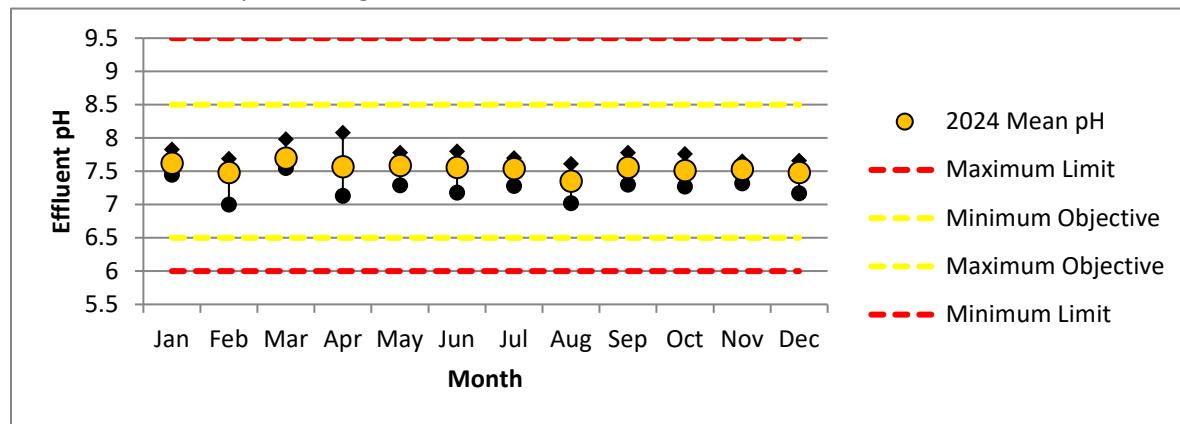

Chart 10. The effluent monthly geometric mean concentration of E. coli in 2024 compared to 2023.

The effluent pH is monitored weekly at a minimum at the Dorchester WWTP. The pH is required to be maintained between 6.0-9.5 at all times. Overall, the plant has provided effective treatment as there

were no results below or above the compliance limits of 6.0-9.5 in 2024. Refer to Chart 11 for the monthly minimum, maximum and mean pH readings. The plant has effectively maintained the pH within the compliance range.

Chart 11. Effluent pH readings for 2024.

Overall, the Dorchester Wastewater Treatment Plant provided adequate treatment in 2024 however, there was one (1) objective exceedance for effluent cBOD<sub>5</sub>, five (5) for effluent TSS, one (1) for TP, and one (1) for TAN in 2024. Refer to Tables 2 &3.

## Section 4: Monitoring Schedule

The monitoring schedule for 2025 is set out in Appendix C. The monitoring schedule for 2024 was adhered to by the operators with the exception of:

Date Scheduled	Date Sampled	Reasons
January 3rd	January 4th	Autosampler Failed
January 10th	January 8th	Schedule conflict/ Switching SBR
February 14th	February 15th	Autosampler Failed

There were only three instances where changes to the sampling schedule were required.

The operators have flexibility with dates for in house sampling, however, all sampling to meet the requirements of the ECA are to be followed. Any changes to the ECA sampling dates requires permission from compliance staff or the Senior Operations Manager.

## Section 5: Operating Issues and Corrective Actions

There were no non-compliances reported in 2024.

In early 2024, Operations staff continued to encounter elevated concentrations of filamentous bacteria which resulted in thick foam on the top layer of the SBR basins. The TSS objective was exceeded in January, April, May, July and August. The filamentous foam covered the SBR basins for most of the year. By adjusting MLSS concentrations in the basins and improving the food to microorganism ratio,

operations were able to better support the growth of nitrifying bacteria and reduce the filamentous bacteria.

In January, the TAN objective was exceeded when SBR#3 experienced a decant arm failure. With SBR#3 out of service, an emergency switch was required of SBR tanks. Given the cold temperatures, the nitrification process was hindered when this switch occurred and resulted in the prolonged recovery of the plant. In June, attempts were made to switch back to SBR#3 but it was discovered that additional repairs were required. In August, all repairs were made and SBR#3 was returned to normal operation however, during the switch overs, the alum dosage was affected and resulted in an objective exceedance of TP in July. The required switching SBR basins also prolonged the issues with filamentous.

In May, the cBOD<sub>5</sub> objective was exceeded due to low DO in the sludge tank. When decanting from the sludge tank during the period of low DO, elevated levels of cBOD<sub>5</sub> were introduced to the treatment plant. Operations were able to optimize the DO levels to ensure adequate treatment in the sludge tank and to reduce influent loadings to the plant from the decant. .

As per the CLI-ECA Schedule E Condition 4.6.4, there were no operating problems at the sewage pumping stations that required corrective actions in 2024.

## Section 6: Maintenance and Emergency Repairs

The normal maintenance activities are completed through OCWA's Workplace Management System (WMS). Attached as Appendix D is the routine maintenance completed at the facility. Emergency and preventative maintenance completed in 2024 were as follows:

- Repaired SBR#3 decanter arm.
- New Win911 hardware installed. SCADA/alarm programming completed.
- Replaced relay switch on MV02.
- Replaced VFD for Blower#2.
- Replaced GFCI outlet for raw and effluent autosamplers.
- Thames Centre replaced battery in plant and station generators.
- Replaced split tubing in autosampler line.
- Repaired sewage leak in PS#3 Valve Chamber and had chamber cleaned out.
- Replaced Blower#3 motor.
- Replaced relay boards on UV Bank A.
- Replaced bulbs and sleeves on UV banks.
- Repaired effluent flow meter.
- Replaced fuses 0254 and 0243 for DO probes and level transducers.
- Replaced SBR1/2 wasting pump.
- Replaces sludge tank manual gate valves (two valves).

## Section 7: Effluent Quality Assurance

Effluent quality assurance is evaluated by monitoring parameters and changes throughout the plants processes. These tests include dissolved oxygen, pH, temperature, settling tests, Mixed Liquor Suspended Solids (MLSS) and Mixed Liquor Volatile Solids (MLVSS). As well, monitoring of the alum dosages and wasting volumes are completed. Data collected from these tests provide valuable information to the operators to make the appropriate adjustments in the treatment process and take corrective actions before the plant reaches its effluent limits.

## Section 8: Calibration and Maintenance Activities

The flow meters were verified by SCG Flowmetrix on November 12-14<sup>th</sup>, 2024. In house meters for pH and dissolved oxygen are calibrated by OCWA operators as per manufacturer's instructions.

## Section 9: Design Objectives

In 2024, there were objective exceedances for effluent cBOD<sub>5</sub>, TAN, TP and TSS concentrations. Table 4 represents the percentage of objectives exceeded.

Table 4. ECA Objectives compared against the monthly average concentrations and percentage of time exceeded in 2024.

Parameter	Monthly average effluent objective	Monthly Average Effluent Result Ranges	% of Objectives exceeded
cBOD5 (mg/L)	5	2.4 – 5.2	8.3
TSS (mg/L)	5	3.6 – 7.0	41.6
TP (mg/L)	0.35	0.10 – 0.41	8.3
TAN (mg/L)*	1.5 (2)	0.23 – 2.48	8.3
E. coli (cfu/100mL)**	100	1.5 – 9.41	0
pH***	6.5-8.5	7.00 – 8.08	0

\*value in brackets represent limits for December 1 to April 30

\*\*expressed as geometric mean

\*\*\*minimum and maximum result (not monthly averages)

In 2024, there were eight (8) objective exceedances (refer to section 5). TSS was the only objective exceedance that occurred in multiple months and was caused by filamentous bacteria in the SBR basins. No parameters have exceeded the objectives greater than 50% of time.

## Section 10: Sludge Generation and Expected Volumes

Sludge is pumped from the basins to the aerated sludge holding tank. The total waste activated sludge transferred to the holding tank in 2024 was approximately 2000m<sup>3</sup>. From this volume, the clear liquid is decanted back to the plant, therefore, the actual sludge amount is only a portion of this total. 795m<sup>3</sup> were hauled off site by Bartels and assessed for its suitability for land application. It is anticipated that in 2025 the total sludge produced will be more than 2024, therefore approximately 2500m<sup>3</sup>. The estimated amount of sludge that will be required to be hauled offsite in 2025 is expected to be more than 2024, as

this is determined based on levels and decanting abilities. The sludge will be land applied with a NASM plan from a licensed hauler or hauled to London's Greenway Pollution Control Centre, if land application is not possible.

## **Section 11: Complaints**

There was one community complaint received in regards to the operation of the treatment plant. On May 2<sup>nd</sup>, a neighboring resident complained of a loud noise emanating from the plant. The operator looked through the plant and found no cause. The resident was contacted again but they did not follow up with any further details.

As per the CLI-ECA Schedule E Condition 4.6.6, there were no community complaints received for the Dorchester sewage pumping stations in 2024.

## **Section 12: Bypasses, Overflows, Abnormal Operating Conditions**

On April 12<sup>th</sup>, 2024 the Dorchester WWTP experienced a power failure due to high winds. With the backwash pump on the cloth filters tripped and were unable to run resulting in a bypass of the post-secondary treatment process. The bypass flow from the filters enters the UV channel and undergoes disinfection prior to entering the receiving waters of the Thames River. Approximately 80m<sup>3</sup> bypassed the post-secondary filters.

There were no overflows, spills, or abnormal operating conditions to report in 2024 for the WWTP or the Dorchester sewage pumping stations.

## **Section 13: Modifications to Sewage Works**

There have been no modifications to the sewage works or the sewage pumping stations.

## **Section 14: Conformance with Procedure F-5-1**

The Dorchester secondary and post-secondary treatment is provided by SBR's, and a cloth disc filter system with final disinfection provided by ultraviolet light. Supplementary phosphorus removal is also achieved with the addition of aluminum sulphate. The treatment components are capable of producing effluent quality that exceeds the effluent design objectives specified in F-5-1. The Dorchester WWTP is required to achieve higher effluent quality standards than the effluent guideline criteria as specified in the ECA.

There have been no bypasses or overflows in the collection system. The Municipality is currently undertaking a Wastewater Condition Assessment and Inventory project to identify sewer infiltration sources.

## **Section 15: Proposed Works**

All construction has been completed for the proposed works identified in the ECA and CLI-ECA.

# **APPENDIX A**

## **Appendix A**

# **Linear Infrastructure 2024 Annual Performance Report**

## **Dorchester Collection System**

**Prepared by: the Municipality of Thames Centre**

## Section 1: Operating Problems and Corrective Actions

No operating problems encountered in this reporting period for the linear infrastructure.

## Section 2: Calibration, Maintenance and Repairs

### 2024 Repairs:

- No Repairs to report on Dorchester Collection System in 2024.

### 2024 Maintenance:

- No Maintenance to report on the Dorchester Collection System in 2024.

## Section 3: Alterations to the System

### **Authorized Alterations to system**

- No alterations to the Dorchester Collection System noted in 2024.

## Section 4: Community Complaints and Concerns

No community complaints or concerns on the operation of the Dorchester Collection System during the reporting period.

## Section 5: Spills of Sewage

No spills in the collection system during the reporting year.

Final OCWA reports will be posted on the Municipal Website.

<a href="#">4112653</a>			1249, DORCHESTER W	PM	Refurbish/Replace/Repair	1	MONTHS	UV Light Insp (1m) - 1249	CLOSE	9/1/24 12:00 AM	9/28/24 01:28 PM	9/28/24 01:28 PM	<p>Termination board replacement 09/13 - Replaced UV bank A termination board as per manufacturer recommendation.</p> <p>Isolated bank A from breaker panel, then opened PDC cabinet and removed old termination board. Cables appear to be in good condition, no obvious signs of wear/damage to termination board.</p> <p>Inserted new board and returned all connections to proper places. ensured connections were tight before returning power to unit. Attempted to turn bank A on in hand once board replacement was complete - similar fault presentation as before. UV HMI showed bank A turning on and operating normally despite a lack of response from the lamps. This state persisted for ~1 minute before "Bank A Fault" alarm recurred.</p> <p>Informed Trojan of findings, awaiting guidance on next steps.</p> <p>Bulb replacement 09/13 - Noted burnt out UV lamp (B-3-4) during termination board replacement. Depowered bank B and replaced faulted bulb with assistance from R. Patel. Returned bank B to normal service, and confirmed all bulbs functioning properly.</p> <p>Shadowed L. Brown for training 09/13 - Returned original termination board to place, bulb replacement. -</p>
